

STATEFUL AD HOC CHECK BOX SELECTIONABSTRACT

- 5 A method for stateful toggling of check box status, implemented as a software program installed and operating on a computer comprising a computer processor coupled to computer memory. Embodiments of the invention include detecting a touch event on a first check box, toggling the status of the first check box to a new status, and repeatedly, for a multiplicity of repetitions, carrying out the steps of
- 10 detecting a drag event for each additional check box onto which a user drags the pointer, wherein the user drags the pointer onto at least one additional check box, and statefully toggling the status of each additional touch box for which a drag event is detected to the new status of the first check box.
